### **Abstract**

**Importance** The article contains a methodology for formalized evaluation of the quality of investment decisions in macroeconomics from the view point of their impact on the balanced economic growth prospects.

**Objectives** The aim of the article is to develop tools for evaluating investment projects prior to the implementation, on the basis of assumptions about data variation of the underlying input-output tables.

**Methods** We used the methodology of input-output and the theory of differential equations and the linear algebra methods. The methodology of analysis of economic systems' dynamic properties, we are developing now, is focused on managing any number of components of the economy, the ultimate purpose of which is to move to a balanced growth of the economy as a whole, not individual sectors only.

**Results** We have reviewed the methodology of system approach, integrating methods of abstraction, analysis, and synthesis both symbolic and verbal, and we identified the problem of

the management quality. We propose a new version of formal evaluation of the quality of investment decisions at the regional and country levels in terms of their impact on economic growth.

**Conclusions and Relevance** We conclude that the completeness of the evaluation includes both expert and computer-based assessment components. We state that predicting or guessing the future is not so much relevant to Russia, as the production of timely, consistent and diverse impacts on the economy, to bring into and retain the economic dynamics in a cone of optimal trajectories (Neumann functions). The research results may be useful in economic decision-making at the regional and country levels.

**Keywords:** input-output, investment decision, management, decision-making, economic growth  
*(Five keywords maximum; no punctuation marks at the end)*

### **Acknowledgments**

We express our gratitude and deep appreciation to...<...> for the valuable advice and comments on the article. *(Any and various acknowledgments are encouraged)*

### **(Article text)**

*(Use no paragraphs; one-and-a-half-spaced typescript pages; minimum 3 cm (1-inch) margins; 12 pt font size standard fonts. Preferred fonts: Times New Roman, Arial, Symbol, Courier)*

Due to the increase in mathematical and software-tools possibilities, there appeared a peculiarity of modern economic theory, as a desire to take into account the diversity of the economic systems' organization criteria at the macro level. The diversity manifests itself in multi- and high dimensionality, the uncertainty of parameters. Outstanding economists of modernity noted that the rapid increase in complexity is one of the most distinctive features of macroeconomic theory of late 20th and early 21st centuries [1, pp. 172–215].

<...>

Thus, we propose a new version of the formal evaluation of the quality of investment decisions, at the regional and country levels, in terms of the impact of these decisions on economic growth. The completeness of assessment lies in its complexity that involves both expert and computer-based assessments. The proposed methodology claims to be included in this complex.
